FERTILIZING STRAWBERRIES AND BRAMBLES

Most garden soils in Kansas have adequate levels of all nutrients other than nitrogen if the area has been fertilized in the past. However, it is recommended that a soil test be done to be sure of the nutrient needs of your fruit planting. If the soil test recommends phosphorus and potassium, use a 10-10-10 fertilizer or 12-12-12 instead of what is recommended below but triple the rate. For example, instead of ½ cup per 10 feet of row, use 1.5 cups per 10 feet of row.

Strawberries (June-Bearing): June-bearing strawberries are not fertilized in early spring as this can make the berries soft and more prone to rot. Fertilize at renovation and again in late August to early September. In most cases, strawberries need primarily nitrogen, so the recommendations are for a high nitrogen fertilizer such as a 27-3-3, 29-5-4, 30-3-3 or something similar. Though recommended for lawns, these fertilizers will also work well for strawberries as long as they do not contain weed killers or crabgrass preventers. Apply ½ cup for every 10 feet of row.

Strawberries (Everbearing or Day-Neutral): Fertilize in the spring as growth starts and again in early August. Use the rates recommended for June-bearing strawberries. Everbearing (dayneutral) strawberries are not renovated.

Brambles (Blackberries and Raspberries): In most cases, brambles need primarily nitrogen, so use a high nitrogen fertilizer such as a 27-3-3, 29-5-4, 30-3-3 or something similar unless a soil test directs otherwise. Though recommended for lawns, these fertilizers will also work well as long as they do not contain weed killers or crabgrass preventers. Apply ½ cup for every 10 feet of row. Fertilize in spring as growth begins.

Will I Have Peaches this Year?

If your peach trees were in bloom during one of our earlier cold snaps, then it will be doubtful that you will have a peach crop this year. I know there won't be much of a peach crop in the Wichita area and probably not many places in southern Kansas. The peaches bloomed earlier than in the rest of the state and the fruit buds were killed by frost. However, the peaches near Manhattan may bear a crop. Low temperatures this past weekend did kill any blossoms that were open but those that were still closed made it through. Actually 28 degrees is the temperature at which we start losing peach buds if they are in full bloom. Unopened buds are more cold tolerant. So how can you tell if your peach buds are still alive? To check for low temperature injury to fruit buds or blossoms, use a sharp knife or razor blade and cut the bud in half longitudinally. If the area in the center is white to cream color and the style of the pistil has not darkened, then no damage has been done. But if the center in several buds or blossoms is dark brown or black, it has been killed.

Keep Mower Blades Sharp
Lawn-mowing season is here. Remember that dull blades give the lawn a whitish cast. A dull blade does not cut cleanly but rather shreds the ends of the leaf blades. The shredded ends dry out, giving the lawn that whitish look. A sharp mower blade is even more important when the turf starts putting up seed heads next month. The seed head stems are much tougher than the grass blades and more likely to shred. Under normal use, mower blades should be sharpened about every 10 hours of use.

**Orchard Grass in Tall Fescue**

Orchardgrass often infests tall fescue lawns. Unfortunately, orchardgrass is lighter green and faster growing than tall fescue, so it is very visible. Homeowners complain of the light green tufts of grass wherever this weed has become established. Even worse, there are no herbicides that will kill the orchard grass without also killing the turf. About the only good thing about orchardgrass is that it is a bunch grass and does not spread. Orchardgrass often comes in as a contaminant in grass seed, especially K-31 tall fescue. Buying good grass seed is the first line of defense against this weed. Orchardgrass is a pasture grass and therefore is not found in the "weed seed" portion of the seed label. Rather, orchardgrass will be listed as "other crop seed." Try to buy grass seed that has 0.0% "other crop seed." Control options are few and painful. Use glyphosate (Roundup, Killzall Weed and Grass Killer, Kleeraway Systemic Weed and Grass Killer and others) to spot spray orchardgrass clumps. Any lawn grasses you hit will be killed, so keep the spots sprayed as small as possible. Wait until the spots have turned brown and then cut out the clumps and replace with a small piece of sod. Large numbers of orchardgrass clumps may mean it is more practical to kill the entire lawn and start over. This should be done in the fall rather than now.

**Fertilizing Cole Crops**

If you planted cole crops such as cabbage, broccoli and cauliflower earlier this spring and made it through our earlier cold snaps, they will need a little fertilizer boost. These plants need to mature before summer heat arrives, so they must grow quickly while the weather is cool. A sidedressing of fertilizer about 3 weeks after transplanting helps plants continue to grow rapidly.

Use fertilizers high in nitrogen for sidedressing such as nitrate of soda or blood meal at the rate of 2 pounds per 100 feet of row. You may also use lawn fertilizers that have close to 30 percent nitrogen such as a 30-3-4 or 29-5-4 but the rate should be cut in half to 1 pound per 100 feet of row. Do not use lawn fertilizers that have weed killers or preventers. Fertilizer must be watered in if timely rains don't do that job for you.

**Herb Program up Next!**

*Learn how to grow and use them!!*

On Thursday, May 3rd, at 6:30 PM in the Butler County 4-H/Community Building at 206 N. Griffith in El Dorado, KS we will be presenting our annual Herb Program. Kay Neff, owner
of Neff Family Farms, will share her vast knowledge of all things herbal. Kay will not only be giving tips on what herbs grow here and how to grow them, she will also be sharing recipes and have a good selection of herbs for sale for those in attendance.

Barb Roths, Butler County Family and Consumer Science Agent, and her volunteers will be preparing different items that are relatively easy to make. So before, during and after the program people will be able to taste the different offerings to see what might interest them.

We are asking that you please pre-register for this event, this will help insure that we have enough materials for all attending. The cost to attend is $5.00 per person, and the registration deadline is Friday, April 27th. To register, come by or call the Butler County Extension office at (316) 321-9660. Or you can e-mail the Butler County Extension office using slewis2@ksu.edu. Put “Herbs” in the subject line and include your name and phone number in the body of the e-mail. So please come and join us for information on buying, growing, preserving, using and cooking with herbs!
